

Policy for the future:

Isuzu understands the connection between our business activities and ecosystems. To help realize a sustainable society, we are driving actions to achieve harmony between our operations and biodiversity.

We partner with various stakeholders to conserve local native biodiversity and help create a society where people and nature can thrive together.

< Examples of Isuzu environmental initiatives >

We have various initiatives underway to conserve biodiversity in and around our business sites.

■ On-site conservation

Experts survey the biodiversity on our plant properties and employees lend a hand in protecting the native ecosystem.

■ Local conservation

Partnering with local governments and organizations, employees and their families support efforts to conserve ecosystems near our operations. This helps ensure the continuity of our operations at each location.

Our plant properties have large areas of green space and many employees feel blessed to be surrounded by nature. However, a survey has revealed ecological imbalances at our sites. Through hands-on activities, employees are learning about the importance of conserving biodiversity. More employees are also participating with their families, providing them opportunities to think about environmental conservation together.

< Future goals/challenges >

Beautification has been the focus of on-site plant conservation initiatives thus far. Going forward, we want to incorporate a biodiversity perspective into these activities and promote conservation of green spaces that protects local native biodiversity.

We will also continue to organize various events so local community members can learn about these efforts.

< A message from Isuzu >

As a leader in transportation, Isuzu strives for a prosperous, sustainable society where people and nature can thrive together.
