

Policy for the future:

The IT industry has contributed greatly to the development of Japan from the past. It is expected to be a growth engine for Japan's continuous development in the future, but at the same time, it is also highly expected to contribute to global measures such as environmental issues and energy conservation.

We not only contribute to the transformation of customers and social structures (innovation), but also have a willingness to change ourselves and are working on various environmental issues.

■ Reduction of power consumption

By introducing automatic lighting equipment using a human sensor, turning off the office during lunch breaks, introducing high-efficiency lighting, cool biz in summer, warm biz in winter, etc., we reduce power consumption and consider preventing global warming.

■ Waste reduction

Helped reduce deforestation by holding paperless meetings, digitizing documents, and recycling paper.

■ Consideration for the environment

Replacing company-owned vehicles with hybrid vehicles and fuel-efficient vehicles, giving consideration to the environment.

■ ISO14001 (environmental management system standard)

Promote environmental preservation activities by acquiring ISO14001 (Environmental Management System Standard) certification at data centers and building an Environmental Management System (EMS).
