

Policy for the future:

We are working on our pioneering goal of reducing CO₂ emissions from our business activities to net-zero levels in fiscal 2030. To this end, we will work to create unique environmental technologies that contribute to energy efficiency and create energy by expanding the use of renewable energy.

At the same time, we will focus on preserving ecosystems that help to absorb CO₂, such as coral reefs and forests.

As an official supporter of International Year of the Reef 2018, Nishimatsu Construction signed an industry-academia cooperation agreement with Tamagawa Academy (K-12) and University (hereinafter, Tamagawa Gakuen) on December 20, 2018. The junior high and high school divisions of Tamagawa Gakuen have been designated a Super Science High School (SSH) by the Ministry of Education, Culture, Sports, Science and Technology. One of the school's research projects is to practice raising, studying, and transplanting coral. Going forward, Nishimatsu Construction will cooperate with Tamagawa Gakuen's efforts and continue promoting marine ecosystem preservation.
