

Policy for the future:

The Sanki Engineering Group strives to create a low/zero-carbon society by enhancing our technology and knowledge and promoting energy conservation and creation.

We believe our business activities help mitigate the risks of global climate change and contribute to the creation of a society in which all living organisms, including humans, coexist in harmony with nature on this planet. It is the rich biodiversity of our planet that enables humans to coexist in nature.

Recognizing the need to maintain biodiversity, we will continue working towards conservation.

<Message to society> Committed to using engineering to contribute to biodiversity conservation.

SANKI YOU Eco Contribution Point System

The SANKI YOU Eco Contribution Point System allows us to partner with customers to donate to environmental conservation activities when a customer adopts Sanki Engineering's proposed energy conservation measures in facility installation projects. Through this points system, CO₂ reduction volume is converted into Eco Contribution Points (1 ton = 100 yen).

This system is designed to promote cooperation with customers towards preventing global warming and creating a sustainable society.

This system contributes to the preservation of biodiversity by donating towards tree-planting activities that promote forest conservation. Since the Eco Contribution Point System was launched in 2010, approximately 24 million yen (as of August 31, 2021) has been donated. These donations have been used to plant some 18,000 trees, a surface area nearly the size of the Tokyo Dome.
