

Policy for the future:

We conduct our business activities under the benefits of ecosystem services made possible by biodiversity. Therefore, we acknowledge the potential negative impacts on the natural capital that supports biodiversity through our business activities, such as GHG emissions and water usage, and work to mitigate these risks. Furthermore, we will continue to focus on the development and provision of products and services that contribute to the conservation and restoration of biodiversity, utilizing various material processing technologies cultivated in our container business over 100 years.

< Examples >

Thorough Implementation of Measures to Prevent Resin Pellet Leakage

- Aiming for zero leakage of resin pellets, the raw materials for plastic products, into the environment, we established the “Resin Pellet Leakage Prevention Guidelines” in 2019 and have been implementing them across the group.

Example of pellet collection screen installation

Development and Sales of Products Contributing to Blue Carbon

- Our group’s Toyo Glass manufactures and sells “Gentle water-soluble glass”, where the active ingredients dissolved in the glass slowly dissolve into the water. It is effective for seaweed farming and diatom proliferation, contributing to the conservation and recovery of the blue carbon ecosystem.

Marine plants thriving on tetrapods bonded with slow water-soluble glass.

< Future initiatives >

After identifying activities that heavily depend on and impact natural capital, we plan to evaluate the risks at each site.

< Message for society >

We will actively commit to biodiversity initiatives, seeing them as an opportunity to evolve our business.
